

**Here are
some key
points you
might want to
share with
your family
members**

"I have found that I have a VUS in a cancer risk gene but they don't know if this is increasing the risk for cancer or not."

"80-90% of the time, VUS results end up being negative, or not increasing cancer risk."

"Because most VUSs end up being negative, they don't test family members for a VUS."

"We have a family history of cancer, however, which alone raises our risk for developing cancer."

"There are things you can do to prevent cancer or catch it early."
